TextLayr

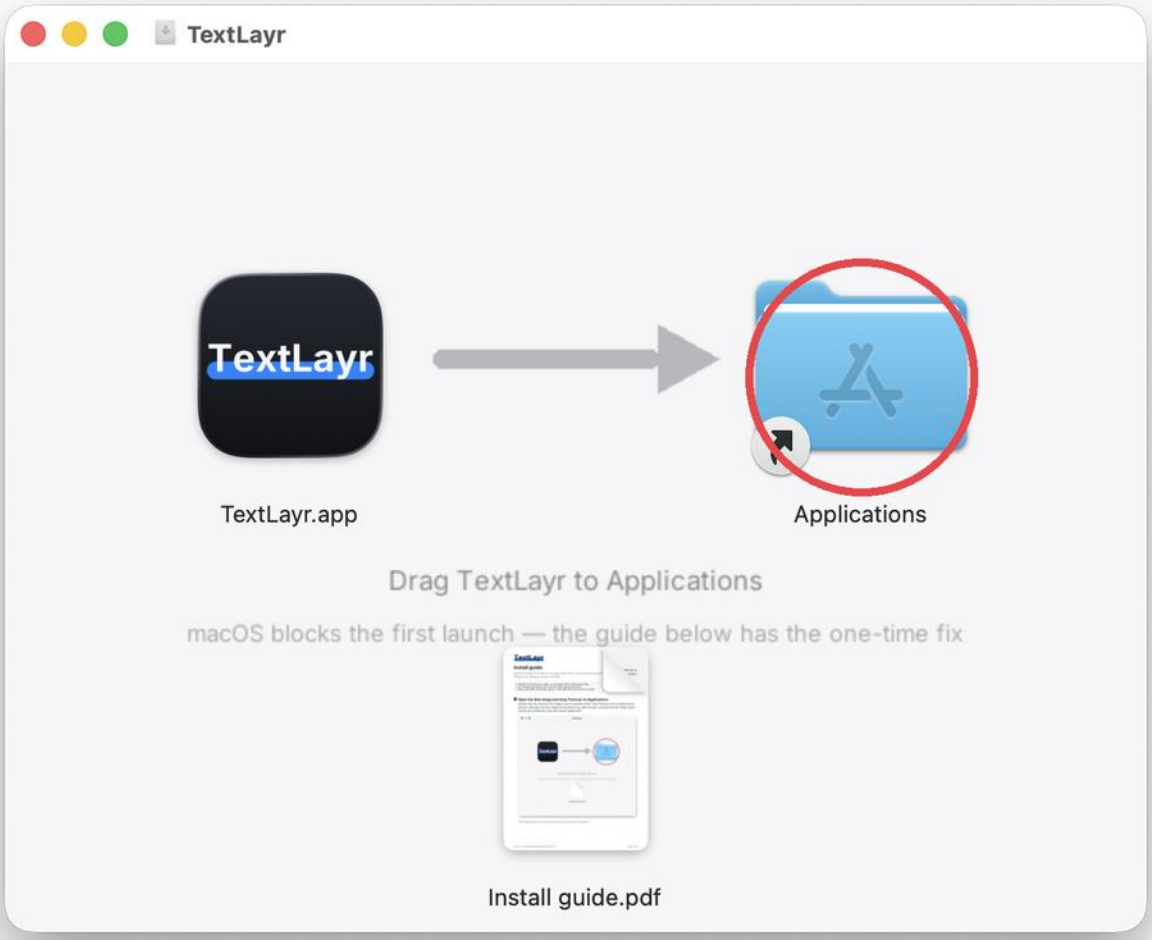

Install guide (macOS)

Requires macOS 13 or later on an Apple Silicon Mac. The download is about 9 MB; the first launch fetches ffmpeg and a Whisper model (~190 MB).

- macOS 13 (Ventura) or later, on an Apple Silicon (M-series) Mac
- An internet connection for the one-time setup download
- About 250 MB of free disk space (~600 MB with the small.en model)

❶ Open the disk image and drag TextLayr to Applications

Double-click the TextLayr disk image in your Downloads folder. Drag TextLayr onto the Applications shortcut, then eject the disk image. Do this before you open the app: running it from the image makes macOS use a temporary copy that cannot update itself.

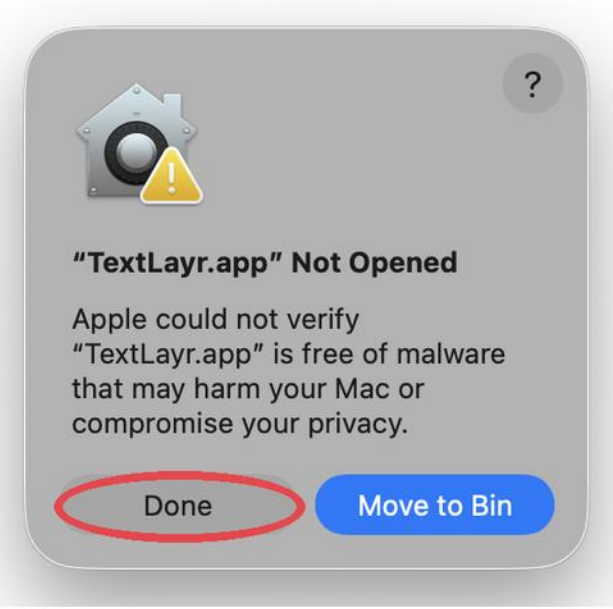

The Install guide in the window has the same one-time fix as page 2.

Through the macOS warning

❷ Open it from Applications and click Done

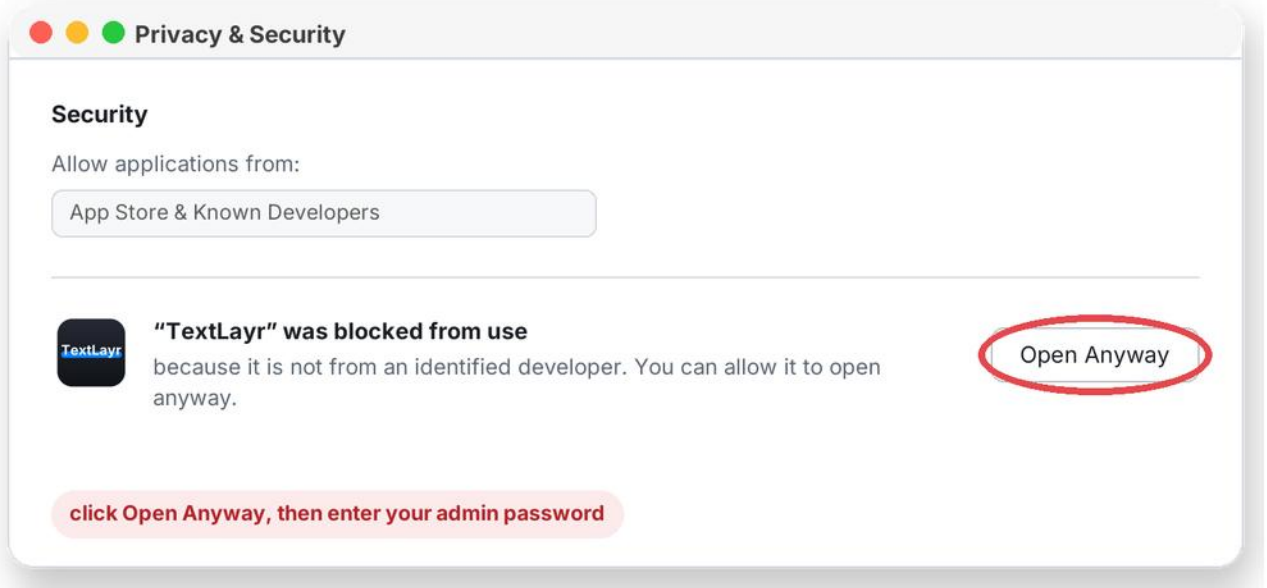

macOS refuses the app and offers to move it to the Trash. Click Done — not Move to Trash (some Macs label it Move to Bin). TextLayr is fine; macOS just cannot verify an app that is not notarized. The exact wording varies by macOS version.

❸ Allow it once in System Settings

Open System Settings → Privacy & Security and scroll to Security. Click Open Anyway next to the message about TextLayr, confirm with your admin password, and open the app again. The button only appears for about an hour after the blocked attempt. No button? Clear the flag in Terminal:

```
xattr -dr com.apple.quarantine /Applications/TextLayr.app
```

❹ Finish setup

Choose base.en (fast, ~148 MB) or small.en (more accurate, ~488 MB), then click Install. ffmpeg and the model are downloaded once; after that TextLayr works offline. No account, no uploads.

Prefer no security prompt at all?
Terminal install: files fetched with curl never get the quarantine flag.

```
curl -fsSL https://paulbuitenhuis.github.io/TextLayr/install.sh | sh
```

Uninstall
Drag TextLayr to the Trash, then remove its downloads in Settings → Diagnostics.
